Write an appropriate concluding sentence for each set.

Hatching chickens can be fun and educational. To begin with, it's very exciting to wait expectantly for 21 days and then suddenly see a tiny beak poke through the shell. At the same time, it's a great way to teach children about the lifecycle of chickens.

Life on the farm is never boring. First, there is a lot of work to do on a farm. There is never an ending to feeding animals, cleaning stalls and coops, and guarding animals from predators. If you have dairy cows or goats, you have to milk them. If you have chickens, you have to collect eggs.

The lifecycle of a chicken differs greatly from that of other farm animals. To begin, chickens are hatched from eggs. Young chickens are called chicks. Females that are less than one year old are called pullets. Young males are called cockerels. After they are one year old, they molt (lose their feathers). When they grow them back, they are called hens and roosters.

The eggs produced by chickens can come in a variety of colors. Leghorns lay white eggs. Americaunas, however, can lay green, pink, or blue eggs. In addition, Australorps lay brown eggs.
